PREEVA EC

Gas Fired Heating, Ventilation & Cooling Units

ErP Lot 21
Seasonal Efficiency and
NOx compliant

 **NORTEK™**
GLOBAL HVAC

ErP Lot 21
 Seasonal efficiency:
 SDH RDH 73-75% *
 SHH RHH 84-85% *
 complies with NOx norms

PREEVA EC

Gas Fired Heating, Ventilation & Cooling Units

PREEVA EC is a new generation of gas fired air heaters to provide combined heating and ventilation with optional cooling.

The units are available with a wide range of heat outputs and cooling capacities. The units are available as non-condensing heaters with thermal efficiencies above 91% or fully condensing heaters with thermal efficiencies of 102% (ncv).

The design combines high thermal efficiency, quality components and ease of maintenance for enhanced life expectancy and reduced life cycle costs.

The PREEVA EC range incorporates an EC plug fan which provides a wide range of air duties and external static pressures. The addition of the optional mixing box enables air filtration.

Model Range

PREEVA EC units are available as indoor models (SDH / SHH) or outdoor weatherproof models (RDH / RHH) suitable for rooftop or low level installation.

- > 7 non-condensing models with heat output ranging from 24-97kW
- > 3 fully condensing models with heat output ranging from 54-99kW
- > Cooling 19-63kW
- > Air volumes 1,700-14,000m³/h
- > External static pressure up to 400Pa

Features & Benefits

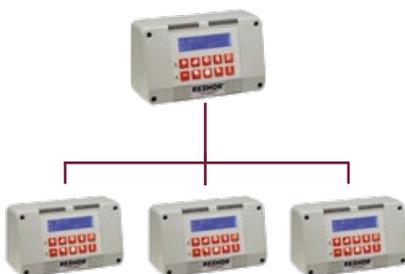

- > PREEVA EC gas-fired units incorporate patented Tcore² 4-pass heat exchanger technology for optimum efficiency and enhanced life expectancy
- > SHH & RHH models also incorporate a patented MacroChannel heat exchanger to provide 8-pass heat exchanger design with full load efficiency of 102%
- > Choice of titanium stabilised aluminised steel or stainless steel heat exchangers to suit application
- > Single burner with multi-try ignition provides enhanced reliability
- > Patented self-aligning burner eliminates possible flame impingement and premature heat exchanger failure
- > Modulating burner fitted as standard. Requires a 0 to 10v DC signal to operate
- > Plug fan with integral EC control

SmartCom

Environmental issues dictate that buildings need to operate as effectively and efficiently as possible. Initiatives such as the Government's Energy Technology (ECA scheme), together with upgrading Part L of the building Regulations, have resulted in consulting engineers, contractors and end users becoming increasingly energy conscious.

SmartCom3, the intelligent energy management controller satisfies the growing need for higher efficiencies and to complement the development of energy efficient heating systems.

Simple to program and operate, SmartCom3 provides cost-effective energy management for small single heater installations through to large multi-zone applications requiring centralised control.

SmartCom MZ allows up to 16 panels to be linked for centralised control

Air Distribution Nozzles

For large open areas, air induction nozzles provide even air distribution with automatic high level air recirculation.

The nozzles are capable of an air throw of up to 60 metres and the high volume turnover induced eliminates the requirement to install additional high level recirculation fans.

Nozzles may be grouped on a distribution plenum to provide controlled terminal velocities on both heating and cooling modes or may be supplied complete with mounting plates for fitting to conventional grille shoes.

The rubber nozzles provide excellent acoustic reduction at high outlet velocities and may be adjusted through 60° for controlled air direction.

Supply Air Fan

The units are ideal for ducted installations with a choice of air volumes and external static pressures up to 400pa (dependent on options fitted). A plug fan with inbuilt EC controller enables Reznor to build the heater to your preferred air duty. Small adjustments can be made at the unit, via a fitted potentiometer to enable on site airflow adjustment for final balancing.

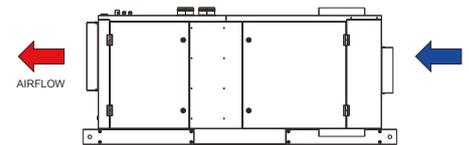

The units may also be used for free-blowing applications with a choice of optional outlet louvres, induction nozzles and 30 or 60 degree downflow heads.

Units may also be supplied with purpose designed air distribution systems.

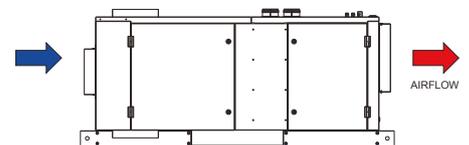

Unit Handing

All motor and burner controls are accessed from a single side. As standard, units are supplied with access on the left hand side in direction of airflow, however units can be supplied with the controls access on either the right hand or left hand side,

this must be clearly specified at order stage and cannot be changed once the units are manufactured.

Left Hand Access

Right Hand Access

Construction

All units are supplied factory assembled on a galvanised frame.

SDH & SHH units are supplied with powder coat finish RAL 9010 (white). Other colours may be available on request.

The RDH & RHH outdoor units are supplied fully weatherproof complete with integral gutters and integrated flue terminal and are as standard supplied with zinc plated pre-painted panels.

All units are fitted with thermal and acoustic insulation as standard.

All service access panels are hinged for ease of access with lift off hinges allowing for access where space is restricted.

Heat exchanger

Patented 4-pass vertical heat exchanger provides high thermal efficiency combined with extended life expectancy. Integral condensate drain between third and fourth pass removes the risk of condensate build up when units operate on fresh air during winter periods.

SHH & RHH models consist of the above heat exchanger with aluminium MacroChannel section to provide increased thermal efficiency up to 102%.

Burner

Single burner with multi-try ignition provides enhanced reliability.

Patented self-aligning burner eliminates risk of flame impingement and premature heat exchanger failure.

A modulating burner is fitted to each unit as standard - a 0 to 10v DC signal is required.

A microprocessor burner control provides full safety monitoring.

Flue

Fan assisted flue with venter fan mounted on top of a stainless steel collection chamber.

For SHH & RHH units an epoxy coated aluminium venter fan is fitted.

Balanced flue operation eliminates the requirement for additional plant room ventilation.

Use of the (optional) concentric roof terminal provides both flue outlet & combustion air inlet connections and requires only a single building penetration. Concentric wall terminals are also available.

Units are also CE certified for fan assisted flue installations where combustion air is drawn from within the heated space or ventilated plant room.

Optional Cooling

Optional DX or chilled water cooling coils may be added where comfort cooling is required.

Controls

Units are supplied fully wired complete with motor controls, an optional

external isolator may also be fitted. Unit electrical protection IP20.

Air handling

Each unit is fitted with a plug fan with fitted EC motor control.

Air Distribution

The units are ideal for ducted installations with a choice of motor size and drives to provide external static pressures up to 400 pascal (dependent on options fitted)

The units may also be used for free-blowing applications with a choice of optional outlet louvres, induction nozzles and 30 or 60 degree downflow heads.

Units may also be supplied with purpose designed air distribution systems.

Mixing box

An optional mixing section is available that can contain aluminium aerofoil section dampers complete with edge seals for precise control of fresh air and recirculation air.

A comprehensive range of damper actuators may be factory fitted and wired to provide occupancy ventilation or fresh air free cooling.

A wide range of filters are available with optional manometer or pressure switch to provide dirty filter indication.

Service Access

Motors and burners are accessed from a single side. Units can be supplied with the controls access on either the

right hand or left hand side, this must be clearly specified at order stage and cannot be changed once the units are manufactured.

SDH Internal unit with optional filter/mixing section

RDH External unit with optional filter/mixing section & Fresh Air Intake Hood

Flue Installation

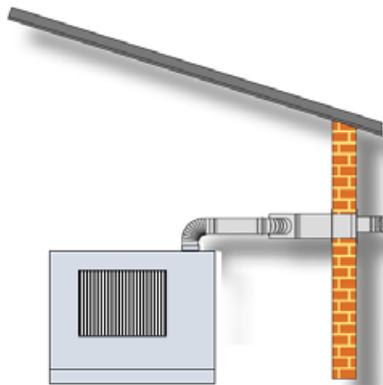

For internal applications, the balanced flue terminal provides both the combustion air inlet and flue outlet from a single building penetration. The terminals are ordered separately from the heaters to suit either a wall outlet or roof outlet. Additional flue and combustion air pipes may be added, up to a maximum of nine metres of flue pipe, plus nine metres (7.5m on model 100) of combustion air pipe. (This reduces by 1.5 metres for every 90° bend fitted).

A differential pressure switch shuts down the unit in the event of inadequate combustion air, blocked flue or flue fan failure.

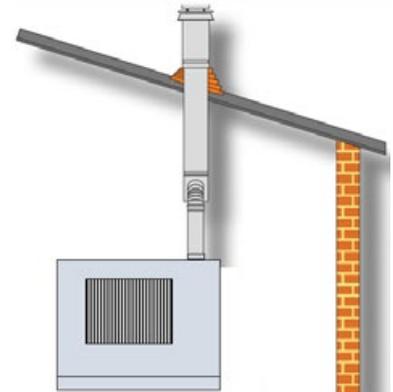

To comply with CE approvals, balanced flue appliances must be used with the manufacturer's balanced flue system.

The units are also certified for fan assisted flue installations, where the combustion air is to be drawn from inside the building; an alternative wall or roof terminal is required for this application. Maximum flue length 14 metres (12 metres on model 100).

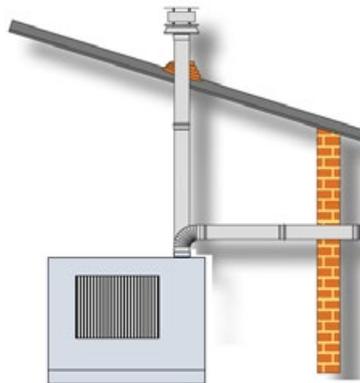

Heater positions and flue arrangements are indicative.
For heater and flue clearances please refer to installation manual.

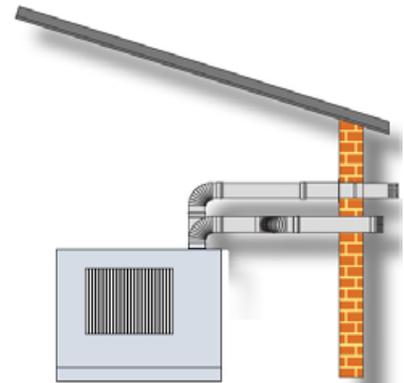

Balanced flue wall outlet (type C12) eliminates expensive roof opening and flashing

Balanced flue roof outlet (type C32)

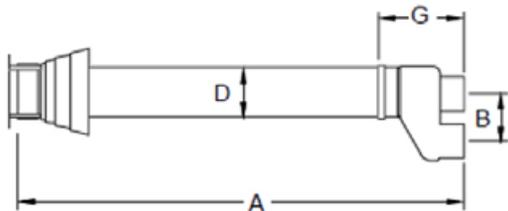

Combustion air through wall, flue outlet through the roof (C52)

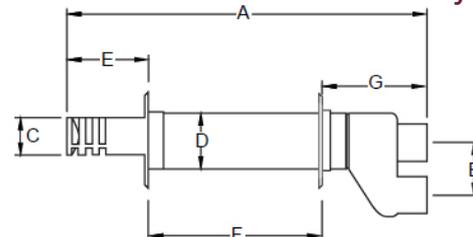

Separate combustion air and flue pipes (type C12) for applications where wall thickness exceeds maximum length shown in flue dimension table
